

ABSTRACT OF THE DISCLOSURE

A transmitter for a tire state monitoring apparatus that is easily connected to a wheel in an optimal manner.

5     The transmitter includes a valve stem connected to a wheel to which the tire is attached. Electric components are mounted on a circuit board to detect the state of the tire.

A casing accommodates the circuit board in the tire. The casing faces toward an outer circumferential surface of the

10    wheel. A connecting portion connects the casing to the valve stem pivotally about a line perpendicular to the axial direction of the valve stem. A pressing mechanism presses the casing toward the outer circumferential surface of the wheel to restrict pivoting of the casing.
